[<sup>125</sup>I]CCK-8 binding to guinea-pig cerebral cortical  
membranes

## Test method

## 15 (i) Membrane preparation

Guinea-pigs were killed by decapitation and bled to death.  
Cerebral cortex was removed, minced in a small quantity of 50 mM  
Tris-HCl buffer (pH 7.4), and homogenized in 20 vol. of the buffer by  
a glass-teflon homogenizer. The homogenate was centrifuged at  
20 30000 x g (16000rpm) for 10 minutes. The pellet was then  
resuspended in the same buffer by a glass-teflon homogenizer and  
recentrifuged at 30000 x g for 10 minutes. This procedure  
(washings) was repeated twice more. The final pellet (membrane)  
was suspended in incubation medium (see below) so as to obtain a  
final protein concentration of 4 mg/ml and frozen at -80°C. All

manipulations were done at 0-4 °C.

(ii) Receptor binding assay

The composition of incubation medium was as follows:

10 mM HEPES (pH 6.5), 5 mM MgCl<sub>2</sub>, 1 mM EGTA, 130 mM NaCl and 0.25 mg/ml bacitracin. Frozen membranes were thawed and aliquots (400 µg protein) were incubated for 60 minutes under shaking at 37 °C in plastic tubes in 500 µL of incubation medium with 50 pM <sup>125</sup>I-CCK-8 in the presence or absence of test compound (1 x 10<sup>-5</sup> M). To determine the non-specific binding, CCK-8 at 1 µM was added. Each assay was performed in duplicate. Reaction mixture was filtered through a Whatman GF/B glass filter to stop the reaction. After washing the filter with 50 mM Tris-HCl (pH 7.4) buffer containing 0.1 % BSA, the radioactivity of the filter was counted. Non-specific binding was subtracted from total binding to yield specific binding. The effect of the test compound was expressed as % inhibition of specific <sup>125</sup>I-CCK-8 binding.

15 Preparation 1-1

To a suspension of magnesium turnings (7.53g) in dry ether (100ml) was added dropwise a solution of isopropyl bromide (36.87g) in dry ether (50ml) at reflux temperature for 1 hour. The mixture was heated at the same temperature for 1 hour and then allowed to cool to 5~10°C in an ice bath. To the mixture was added dropwise a solution of 2-aminobenzonitrile (11.81g) in dry tetrahydrofuran (100ml) at the same temperature for 1 hour. The mixture was stirred additionally 1 hour and then heated under reflux for 3 hours. The reaction mixture was allowed to cool to 5~10°C in an ice bath.

A 3N aqueous hydrochloric acid was added dropwise to the mixture for 1 hour and then heated under reflux for 3 hours. The resultant mixture was concentrated in vacuo to remove the organic solvent. The residue was extracted with chloroform (2 × 300ml). The  
5 extracts were combined and washed with a brine (2 × 100ml). Dryness over magnesium sulfate and evaporation gave a crude product. The product was purified by column chromatography on silica gel with chloroform. The fractions containing the desired  
10 product were combined and evaporated in vacuo to afford a pure 2-isopropylcarbonylaniline (15.35g) as a colorless oil.

To a solution of o-toluidine (27.98g) and cyclohexanecarbonitrile (14.25g) in toluene (200ml) was added dropwise 1N-borontrichloride toluene solution (131ml) under stirring and cooling in an ice-bath below 5°C. After the addition was completed, the mixture was stirred at ambient temperature for 0.5

25

hour. The mixture was cooled again and aluminum chloride

(17.40g) was added portionwise. The mixture was gradually warmed to ambient temperature and then refluxed under stirring for 7.5 hours. The reaction mixture was cooled in an ice-bath and 2N-hydrochloric acid (180ml) was added dropwise under stirring. The resultant mixture was refluxed again for 2.5 hours. The reaction mixture was cooled under stirring and the resultant precipitate was filtered off. The filtrate and washings with ethyl acetate were combined and extracted with ethyl acetate. The organic extract was washed with 1N-hydrochloric acid twice and brine successively and dried over magnesium sulfate. Removal of the solvent in vacuo gave an oil, which was subjected to column chromatography on silica gel eluting with a mixture of n-hexane and methylene chloride (2:1). The fractions containing the desired product were combined and evaporated in vacuo to give 2-cyclohexylcarbonyl-6-methylaniline (27.9g, 98.4% yield) as a light yellow oil.

#### Preparation 17-2

To a solution of N-benzyloxycarbonyl-2-(benzotriazol-1-yl)glycine (3.59g) in dry tetrahydrofuran (THF, 30ml) was added oxalyl chloride (1.05ml) at 0-5 °C under stirring and nitrogen stream. After one drop of dimethylformamide was added, the mixture was stirred for 2 hours under the same conditions. To the reaction mixture was added dropwise a mixture of 2-cyclohexecarbonyl-6-methylaniline (2.17g) and N-methylmorpholine (2.23g) in dry THF for 20 minutes under the same conditions. The mixture was allowed to warm to ambient temperature and stirred for 1 hour. THF was removed in vacuo to afford a residue, which was dissolved in ethyl acetate and washed with diluted aqueous sodium bicarbonate, water and brine successively. After drying over magnesium sulfate, the solvent was removed in vacuo to give an amorphous mass (5.77g), which was dissolved in methanol (4ml). To the solution was added 9M methanolic ammonia (22ml) and the mixture was stirred at ambient temperature overnight. The mixture was evaporated in vacuo to give a residue, which was dissolved in ethyl acetate and washed with 1N-sodium hydroxide aqueous solution and water. The organic layer was dried over magnesium sulfate and evaporated in vacuo to give a residue, which was dissolved in acetic acid (60ml). Ammonium acetate (4.0g) was added to the solution and the mixture was stirred for 1.5 hour at ambient temperature. Acetic acid was removed in vacuo to give a residue, which was dissolved in ethyl acetate and washed with diluted sodium hydroxide aqueous solution and water successively. After drying over magnesium sulfate, the

solvent was removed in vacuo to give a crystalline mass, which was pulverized in a mixture of diisopropyl ether and n-hexane and collected by filtration to give (3RS)-3-benzyloxycarbonylamino-5-cyclohexyl-9-methyl-2,3-dihydro-1H-1,4-benzodiazepin-2-one (2.36g, 58.3% yield) as a crystalline powder.

To a solution of 2-chloroacetyl-6-methylaniline (1.84g) in methanol (50ml) was added a 15% aqueous solution of sodium methanthiolate (14.01g, 3eq.mol) under stirring and cooling in an ice-bath. The mixture was stirred at ambient temperature for 2.5 hours. From the reaction mixture methanol was removed in vacuo and dissolved in ethyl acetate. The solution was washed with water and brine successively and dried over magnesium sulfate. Removal of the solvent in vacuo gave an oil (2.26g), which was subjected to column chromatography on silica gel eluting with a mixture of n-hexane and chloroform (10:1). Preparation 45-2

To a solution of N-benzyloxycarbonyl-2-(benzotriazol-1-  
yl)glycine (10.77g) in dry tetrahydrofuran (80ml) were added oxalyl  
0 chloride (2.88ml) and one drop of dimethylformamide at 0°C under  
stirring and nitrogen stream. The mixture was stirred for 2 hours  
under the same conditions. To the reaction mixture was added  
dropwise a mixture of 2-isobutyryl-6-methylaniline (5.32g) and N-  
methymorpholine (6.68g) in dry tetrahydrofuran (30ml) for 20  
minutes under the same conditions. After the addition was

completed, the mixture was stirred at ambient temperature for 0.5 hour. The resultant precipitate was filtered off and the filtrate and washings were combined and evaporated in vacuo. The residue was dissolved in 20% methanolic ammonia (80ml) and stirred at ambient temperature overnight. The resultant precipitate was collected by filtration and washed with cold methanol to give the first crop of the desired product (3.25g, 29.6%). The filtrate and the washings were combined and evaporated in vacuo to afford a residue, which was dissolved in ethyl acetate and washed with 1N-NaOH aqueous solution and water. The organic layer was dried over magnesium sulfate and evaporated to give a residual oil, which was dissolved in acetic acid (70ml) and treated with ammonium acetate (7.0g) for 4 hours at ambient temperature. After removal of acetic acid in vacuo, the residue was dissolved in ethyl acetate and washed with diluted hydroxide aqueous solution and water successively. The organic layer was dried over magnesium sulfate and evaporated in vacuo to give an orange oil, which was triturated in methanol overnight to afford the second crop of the desired product (1.01g, 9.2%), (3RS)-3-benzyloxycarbonylamino-5-isopropyl-9-methyl-2,3-dihydro-1H-1,4-benzodiazepin-2-one.

To a mixture of 2-toluidine (32.8g, 0.30mol) and acetonitrile (6.22g, 0.15mol) in dry toluene (200ml) was added 1N-solution of boron trichloride in toluene (150ml) dropwise under stirring and cooling in an ice-bath for 2 hours. After the addition was completed, the mixture was stirred for 1 hour at ambient temperature and cooled again. To the cooled mixture was added aluminum chloride (20.0g, 0.15mol) portionwise. The resultant mixture was stirred at ambient temperature for 1 hour and refluxed for 5 hours. After cooling the reaction mixture in an ice-bath, 2N-HCl (200ml) was added. The mixture was then refluxed for 2.5 hours. After cooling the mixture, ethyl acetate was added. The separated organic layer was washed with water twice and dried over magnesium sulfate. Removal of the solvent in vacuo gave crystals, which was washed with n-hexane with stirring and collected by filtration to give 2-acetyl-6-methylaniline as a yellow crystal (8.91g, 39.8%).

To a solution of N-benzyloxycarbonyl-2-(benzotriazol-1-yl)glycine (14.11g) in dry tetrahydrofuran (100ml) were added oxalyl chloride (3.77ml) and dimethylformamide (3 drops) under stirring at 0°C in an ice-salt bath under nitrogen stream. After the mixture was stirred under the same conditions for 2 hours, a mixture of 2-acetyl-6-methylaniline (4.30g) and N-methylmorpholine (8.74g) in tetrahydrofuran (20ml) was added dropwise for 20 minutes. The mixture was washed with water twice and dried over magnesium sulfate. Removal of the solvent gave an intermediate product as an oil, to which was added 20% methanolic ammonia (75ml) and stirred at ambient temperature overnight. The resultant precipitate was collected by filtration and washed with cold methanol and diisopropyl ether successively, and dried to give (3RS)-3-benzyloxycarbonylamino-5,9-dimethyl-2,3-dihydro-1H-1,4-benzodiazepin-2-one as a white crystalline powder (6.17g, 63.5%).

20 Preparation 74-2

A mixture of (3RS)-1-cyclohexylcarbonylmethyl-3-[N-t-butoxy-carbonyl-(S)-phenylalanyl]amino-5-ethyl-9-methyl-2,3-dihydro-1H-1,4-benzodiazepin-2-one (47.70g, 81.02mmol) and 4N-solution of hydrogen chloride in ethyl acetate (800ml) was stirred for

0.5 hour under cooling in an ice-bath and stirred for 3 hours at ambient temperature. After removal of hydrogen chloride as completely as possible by babbling of nitrogen gas, the solution was washed with a dilute aqueous solution of sodium bicarbonate twice and with water. After drying over magnesium sulfate, the solvent was evaporated in vacuo to give an oily mixture of diastereoisomers (35.51g), which was separated by medium pressure liquid chromatography on silica gel eluting with a mixture of chloroform and methanol (20:1). The fractions containing the following A-isomer and B-isomer were collected and evaporated in vacuo to afford amorphous masses of pure A-isomer (11.81g) and B-isomer (14.30g) respectively.

A mixture of (3S)-1-cyclohexylcarbonylmethyl-3-[(S)-phenylalanyl]-amino-5-ethyl-9-methyl-2,3-dihydro-1H-1,4-benzodiazepin-2-one (14.30g) and phenyl isothiocyanate (4.35g) in methylene chloride (250ml) was heated under stirring with vaporizing spontaneously. 15 After allowing to cool to room temperature, ethyl acetate and water were added to the reaction mixture under stirring. The separated organic layer was washed with water and brine, and then dried over sodium sulfate. The solvent was evaporated in vacuo to afford an amorphous powder, which was washed with diisopropyl ether and

20 collected by filtration to give a pale gray powder (320mg). To the powder dissolved in 1,4-dioxane was added 4N-hydrogen chloride in 1,4-dioxane (0.5ml) at ambient temperature under stirring.
